

HT created ht.tr<sup>®</sup> to provide its customers with visibility to their shipment details, location and status.

Through ht.tr<sup>®</sup>, HT's Web based tracking application, any attribute of an order can be tracked, completely visible on the Web. Item quantities, required ship dates, commodity description and estimated vs. actual ex-factory dates along with the complete process are managed in our operational system, and made available via ht.tr<sup>®</sup> from the time the order is placed.

Shipment information, captured and updated throughout the shipment process, visible on the Web, in your own industry specific terminology. By delivering order management detail over the Web it can be accessed by different entities within the supply chain, tailored to each of their proprietary viewing needs.

You define the performance criteria for your vendors, and through ht.tr<sup>®</sup>, HT assists them in meeting your unique requirements by tracking their performance. ht.tr<sup>®</sup> allows you the ability to run reports on anything from vendor timeliness to cargo release.

Regardless of the mode of transport, ht.tr<sup>®</sup> allows you to see all orders and items that are on-hand at origin, giving you order optimization and planning capabilities. By managing the ship windows and ex-factory dates of orders, we support a logistics program that is demand-driven instead of supply-driven.

Combining Ocean, Truck Freight Forwarding or any of our multi-modal services with our Order Management services, gives you comprehensive Web visibility. Basic shipment-level detail combined with order or item level detail can be viewed in ht.tr<sup>®</sup>, effectively managing the 'as ordered' verses 'as shipped' quantities and actively monitoring an order as it is filled over a period of time keeps the supply chain moving.

When HT is your logistics service provider your orders are tracked and made immediately viewable to you via ht.tr<sup>®</sup> on the Web. Both our Import and Export departments use the same operational system, to keep shipment data updated continuously throughout the process.

Our global Customs services focus on the compliance, release and reporting needs of the marketplace. You can continue to track your orders through the release process via ht.tr<sup>®</sup>. We focus on the most efficient methods of capturing, utilizing and managing data from input at origin through statistical reporting to client-specific levels.

HT offers a comprehensive, flexible spectrum of distribution and warehousing services. Our combination of coverage and technology gives seamless control over the global supply chain through ht.tr<sup>®</sup>. With views into product receipt, inventory that has been stocked, picked, kitted, and shipped, including delivery information, you have complete visibility from order conception to cargo delivery.
